AN ORDINAL  
CLASSIFICATION FOR THE  
FAMILIES OF FLOWERING  
PLANTS

---

*The Angiosperm Phylogeny Group*<sup>1</sup>

ABSTRACT

Recent cladistic analyses are revealing the phylogeny of flowering plants in increasing detail, and there is support for the monophyly of many major groups above the family level. With many elements of the major branching sequence of phylogeny established, a revised suprafamilial classification of flowering plants becomes both feasible and desirable. Here we present a classification of 462 flowering plant families in 40 putatively monophyletic orders and a small number of monophyletic, informal higher groups. The latter are the monocots, commelinoids, eudicots, core eudicots, rosids including eurosids I and II, and asterids including easterids I and II. Under these informal groups there are also listed a number of families without assignment to order. At the end of the system is an additional list of families of uncertain position for which no firm data exist regarding placement anywhere within the system.

---

Why rearrange families, still less formalize orders? Higher-level classifications, the grouping of species into families, orders, etc., are needed as reference tools not only in systematics but also in many other branches of biology. Knowledge of phylogenetic relationships of major groups of organisms, that is, a phylogenetic perspective, is becoming increasingly important, and hence the need for a phylogenetic classification as a reference tool is also becoming imperative.

Our primary focus is on orders with a secondary emphasis on families of flowering plants. The family is central in flowering plant systematics. For example, in studying an unknown plant we usually first identify it to family. The orders, on the other hand, have until quite recently been of little importance, either being morphologically unrecognizable or in most cases lacking any evolutionary coherence (Heywood, 1977; Merxmüller, 1977). However, orders are useful in teaching, for studying

<sup>1</sup> Recommended citation, abbreviated as "APG, 1998." This paper was compiled by Kåre Bremer, Mark W. Chase, and Peter F. Stevens, equally responsible and listed here in alphabetical order only, with contributions from Arne A. Anderberg, Anders Backlund, Birgitta Bremer, Barbara G. Briggs, Peter K. Endress, Michael F. Fay, Peter Goldblatt, Mats H. G. Gustafsson, Sara B. Hoot, Walter S. Judd, Mari Källersjö, Elizabeth A. Kellogg, Kathleen A. Kron, Donald H. Les, Cynthia M. Morton, Daniel L. Nickrent, Richard G. Olmstead, Robert A. Price, Christopher J. Quinn, James E. Rodman, Paula J. Rudall, Vincent Savolainen, Douglas E. Soltis, Pamela S. Soltis, Kenneth J. Sytsma, and Mats Thulin (in alphabetical order). Chase, Jodrell Laboratory, Royal Botanic Gardens, Kew, Richmond, Surrey, TW9 3DS, U.K.; P. F. Stevens, Harvard University Herbaria, 22 Divinity Avenue, Cambridge, Massachusetts 02138, U.S.A.

family relationships, and in positioning genera of doubtful affinity. The didactic value of suprafamilial groupings has been emphasized by various authors (e.g., Dahlgren, 1975; Thorne, 1976; Davis, 1978; Takhtajan, 1997). This value is even more evident now that the phylogeny of flowering plants is being disclosed in increasing detail. Many of the orders recognized by earlier authors are not monophyletic, yet there is a pressing need for names to communicate the knowledge of monophyletic groupings of families that are becoming evident. With the major branching sequence of flowering plant phylogeny becoming clearer, a revised familial and ordinal classification is feasible.

Flowering plant classification systems from the late 1970s seemed to be stable and show substantial agreement, but this stability has been rudely shattered as new kinds of data and new methods of analyzing conventional data have become firmly established (Stevens, 1986). Classifications such as those by Cronquist (1981) and Takhtajan (1980), although still in frequent use, have become outdated. Of more recent classifications, that by Goldberg (1986) of the dicotyledons predates the advent of molecular studies at higher levels, as does that by Dahlgren et al. (1985) of the monocotyledons. However, the latter incorporated much new data and provided synapomorphy schemes for many groups. The recent system of Takhtajan (1997), although extremely elaborate, is made less useful because his propensity for splitting often results in well-known families being dismembered, then reassembled as orders. Furthermore, the findings of recent molecular studies, despite being cited, have hardly influenced his classification.

We conclude that there is a great need for a new, phylogenetic classification of flowering plants, providing names for major monophyletic groups of families. Obviously, it is not possible, nor is it desirable, to name all clades in the entire phylogeny. Any such complete classification would be so cumbersome that it would be useless for general communication. Systematists need to come to some kind of agreement concerning which clades to recognize and name, so that a reference tool of broad utility can be formulated and used to discuss diversity. An ordinal classification of flowering plant families is here proposed for that purpose (pp. 538–542). It recognizes a selected number of monophyletic suprafamilial groups, that is, clades in the phylogeny of flowering plants that are supported by at least one, and often several, lines of evidence. These are clades to which we find it useful to refer when we communicate information about higher-level interrelationships of the flowering plants.

We note that the selection of clades to be represented in a formal classification is different from the procedure of naming these clades. The latter issue of biological nomenclature in phylogenetics is currently much debated (e.g., Cantino et al., 1997; de Queiroz, 1997; Lidén et al., 1997), but we have not adopted any “phylogenetic naming” *sensu de Queiroz and Gauthier (1994)*. We operate under the current *International Code of Botanical Nomenclature* (Greuter et al., 1994) and choose to emphasize the ranks of family and order. The Linnaean categories serve as a convenient mnemonic device for remembering hierarchical relationships, but it should of course be realized that groups of the same rank are evolutionarily non-comparable units unless they are sister groups.

There are noteworthy problems when establishing the names for taxa at ordinal and other higher taxonomic levels. Until recently, little attention has been paid to the nomenclature at these levels, and our knowledge of the early literature in which such names were used is imperfect. This situation has in considerable part been rectified by Reveal's (1998) Herculean labors. The principle of priority is not mandatory for taxa above the rank of family, although authors are exhorted “generally” to follow this principle (Greuter et al., 1994). We have tried to balance priority with general usage when assigning names to orders, but even if future bibliographic work discloses earlier ordinal names, changes are not mandated.

Which clades should be recognized in classification, or in our case, how should the orders be circumscribed? Given the primary principle of monophyly, that of recognizing clades and not grades in classification, there are nevertheless many considerations to be taken into account when circumscribing taxa at ordinal as well as all other hierarchical levels above that of species. Classification is not only a matter of grouping according to the principle of monophyly, but it is also a matter of communication (note that whatever philosophy of naming is adopted, there has to be some consensus as to the clades we are going to use in general botanical communication). For us, this raises the question of ranking, that is, after having selected clades in the phylogeny to be named, they have to be assigned an appropriate place in the hierarchy, in our case, family and order (e.g., Backlund & K. Bremer, 1998; Stevens, 1998). In choosing between alternative circumscriptions it is desirable to recognize groups that are well supported. It is also useful to select groups that have some kind of easily observed morphological synapomorphies, although this may be difficult at the ordinal level and

even sometimes at the family level. Synapomorphies also often include (sometimes exclusively) anatomical, biochemical, and developmental characters.

Many of our ordinal names are already well established and used in earlier classifications and systematic treatments. So far as they represent monophyletic groups, we retain well-known orders in the interest of preserving stability. In other cases, the size of the orders comes into consideration. However, what is reasonably broad circumscription? From the point of view of memorization of names, groups of 2–6 or a few more would seem to be ideal, and there is evidence that systematists in the past have commonly recognized groups of this size (Stevens, 1997). However, with the discoveries of new species, genera, and families, the sizes of genera, families, and orders have increased, and many orders now comprise 10–20 families, or even more. Other orders contain a few families only, and if there are only two or three families in an order, “one is not far from leaving the families unplaced” (Copeland, 1957). Concerns about the doubtful value of recognizing similarly small groups have also been expressed by others (e.g., Burtt, 1977). Nevertheless, we have chosen to recognize a number of small orders because these represent clades for which monophyly and relationships are well supported, and this better conveys the interrelationships of the families included rather than leaving them unclassified to order.

In general, we adopt a broad circumscription of the orders. We recognize 462 families and 40 orders of flowering plants. Cronquist (1981) recognized 321 families and 64 orders, Thorne (1992) 440 families and 69 orders, and Takhtajan (1997) no less than 589 families in 232 orders. Our wider ordinal circumscription is not because finer details of the phylogeny within the orders are as yet unclear, but because we think the classification will be more useful with a limited number of larger orders. As we develop more firmly supported phylogenies within and among orders, groups at the infraordinal and supraordinal levels can be recognized. Hence we anticipate that there will be little need to change the circumscription of the orders recognized here, except for inclusion of yet unassigned families of unknown systematic position and the transfer of misplaced families. Additional orders may have to be recognized as the phylogenetic relationships of families that are not yet placed are clarified. Discussion as to whether a widely accepted monophyletic group should be a superorder, order, suborder, or family is largely vac-

uous because this will always be an arbitrary decision.

Takhtajan (1997) opted in favor of “smaller, more natural families and orders, which are more coherent and better-defined, where characters are easily grasped, and which are more suitable for information retrieval and phylogenetic studies, including cladistic analyses (e.g., because it reduces polymorphic codings).” However, the size of a group has nothing to do with its “naturalness.” For a smaller group, one will often be able to say more about all of its constituent members, and so the characters may be more easily grasped. However, segregates of well established monophyletic families like Rubiaceae (Gentianales) or Asteraceae (Asterales) would by Takhtajan’s generalization also be more natural; by this criterion, the smaller the group, the more natural it will necessarily be, so there is no ranking criterion to be derived from “naturalness.” If by “more natural” is meant “has more synapomorphies” then this, too, is incorrect; the number of synapomorphies is not connected to the size of the group or the hierarchical level at which it is recognized.

In our classification, these considerations have had little impact. The principle of monophyly in combination with the desirability of maintaining already well established and familiar entities has largely formed the ordinal classification. Monofamilial orders (and monogenetic families) are avoided as much as possible, minimizing redundancy in classification. In a few cases we have, however, recognized some monofamilial orders (Ceratophyllales, Acorales, Arecales) because these are sister groups of more than one other order. Hence, the families of these monofamilial orders cannot be included in any other order without violating monophyly.

The principle of monophyly in combination with the mandatory usage of the family category (Greuter et al., 1994) may lead to the recognition of many small families. For example, in Dipsacales, if Dipsacaceae and Valerianaceae are to be retained as families separate from Caprifoliaceae, the principle of monophyly requires the recognition also of Diervillaceae, Linnaeaceae, and Morinaceae (Backlund & K. Bremer, 1998; Backlund & Pyck, 1998). This is because each of these latter families is the sister group of more than one family so they cannot be merged with any other family without violating monophyly. Similar considerations apply at the ordinal level. Unfortunately, no absolute guidelines as to reasonable practice can be offered, but we simply observe that caution is always in order.

In other cases there are small families that may be reduced to synonymy of their sister group if the

latter consists of a single family. Examples are Cabombaceae, which may be merged with Nymphaeaceae, and Kingdoniaceae, which may be merged with Circaeasteraceae (Ranunculales). Such commonly recognized families that nevertheless may be merged with their sister family are in our classification placed within square brackets below the family with which they may be merged (in Ranunculales either Fumariaceae or both Fumariaceae and Pteridophyllaceae may be merged with Papaveraceae; alternatively, either Pteridophyllaceae or both Fumariaceae and Pteridophyllaceae may be retained as distinct).

We do not attempt to thoroughly revise family circumscriptions. In general we follow recent authors and attempt to recognize as many monophyletic families as possible. It should be emphasized, however, that following additional investigation some families listed below may be shown to be non-monophyletic; revised circumscriptions, either by merging or splitting, into monophyletic taxa are not yet possible given our current knowledge. Examples are Euphorbiaceae and Flacourtiaceae of Malpighiales (Källersjö et al., 1998) and several families of Mytales (Conti et al., 1996; Gadek et al., 1996) and core Caryophyllales (which comprise Achatocarpaceae, Aizoaceae, Amaranthaceae, Basellaceae, Cactaceae, Caryophyllaceae, Didiereaceae, Molluginaceae, Nyctaginaceae, Phytolaccaceae, Portulacaceae, Sarcobataceae, and Stegnospermataceae; Hershkovitz & Zimmer, 1997). Other probably non-monophyletic families that cannot yet be recircumscribed are Boraginaceae (euasterids I; Chase et al., 1993), Scrophulariaceae (Lamiales; Olmstead & Reeves, 1995), and Santalaceae (Santalales; Nickrent & Duff, 1996; Nickrent et al., 1998). Brassicaceae (Brassicales) include also the former, paraphyletic Capparaceae (Brassicaceae *sensu stricto* being nested inside Capparaceae; Judd et al., 1994; Rodman et al., 1996). A supposedly parallel case comprises Apiaceae and Araliaceae (Apiales), since the former have been assumed to be nested inside the latter (Plunkett et al., 1996). However, with a transfer of Hydrocotyloideae from Apiaceae to Araliaceae, it seems that two monophyletic families can be recognized, only a few genera remaining unplaced (Plunkett et al., 1997). Delimitation of Bombacaceae, Malvaceae, Sterculiaceae, and Tiliaceae (Malvales) is problematical, and only Malvaceae are monophyletic (Alverson et al., 1998; Bayer et al., 1999). Here all four are treated together as a single monophyletic family, Malvaceae *sensu lato* (Judd & Manchester, 1997).

Our proposed classification is a modification of

that conceived by Bremer et al. (1995, 1996, 1997) and since 1996 available on the Internet (Bremer et al., 1998). This classification is based on various recently published mostly molecular phylogenetic analyses (e.g., Chase et al., 1993; Chase et al., 1995; Bremer et al., 1994; Struwe et al., 1994; Nadot et al., 1995; Nickrent & Soltis, 1995; Soltis et al., 1995; Gadek et al., 1996; Gustafsson et al., 1996; Morton et al., 1996; Soltis & Soltis, 1997; Soltis et al., 1997; Anderberg et al., 1998; Backlund & B. Bremer, 1998; Bakker et al., 1998; Källersjö et al., 1998; Soltis et al., 1998; Thulin et al., 1998; further references above). The major differences are in the expansion of Alismatales (including also Araceae), Caryophyllales (including Drosieraceae, Nepenthaceae, Polygonaceae, Plumbaginaceae, and several other families outside the traditional, core Caryophyllales), the recognition of a comparatively widely circumscribed Rosales (including Rhamnaceae, Urticaceae, Moraceae, and their allies), in the addition of a number of smaller orders (Ceratophyllales, Acorales, Arecales, Proteales, Garryales, Aquifoliales), and in the deletion of a few others (Aristolochiales, Nymphaeales, Bromeliales, Trochodendrales, Zygophyllales). Monocots and eudicots are not formally ranked and named because it is not yet clear at which level they should be recognized. The same problems occur with commelinoids (a phylogenetically derived subgroup of monocots) and with rosids and asterids (subgroups of eudicots), although these are commonly known as subclasses Commelinidae, Rosidae, and Asteridae, respectively.

Well supported ordinal interrelationships are shown in Figure 1. Interrelationships among the basal branches of the tree and the position of the root of the flowering plant phylogeny remain elusive. Within the eudicots there is increasing support for a large subgroup with predominantly pentamerous and isomerous flowers, the core eudicots, mainly comprising Caryophyllales, Santalales, Saxifragales, rosids, and asterids. Rosids and asterids each comprise two large subgroups, eurosids I and II and euasterids I and II, also receiving increasing support as monophyletic. These correspond to the similarly numbered rosid and asterid clades of Chase et al. (1993).

Under each of the supraordinal groups of monocots, commelinoids, core eudicots, rosids, etc., there are a number of families listed without assignment to order. These families are known to belong within the major group under which they are listed, but their ordinal position is still uncertain. Similarly, Amborellaceae, Austrobaileyaceae, Cannellaceae, etc., are listed at the beginning because

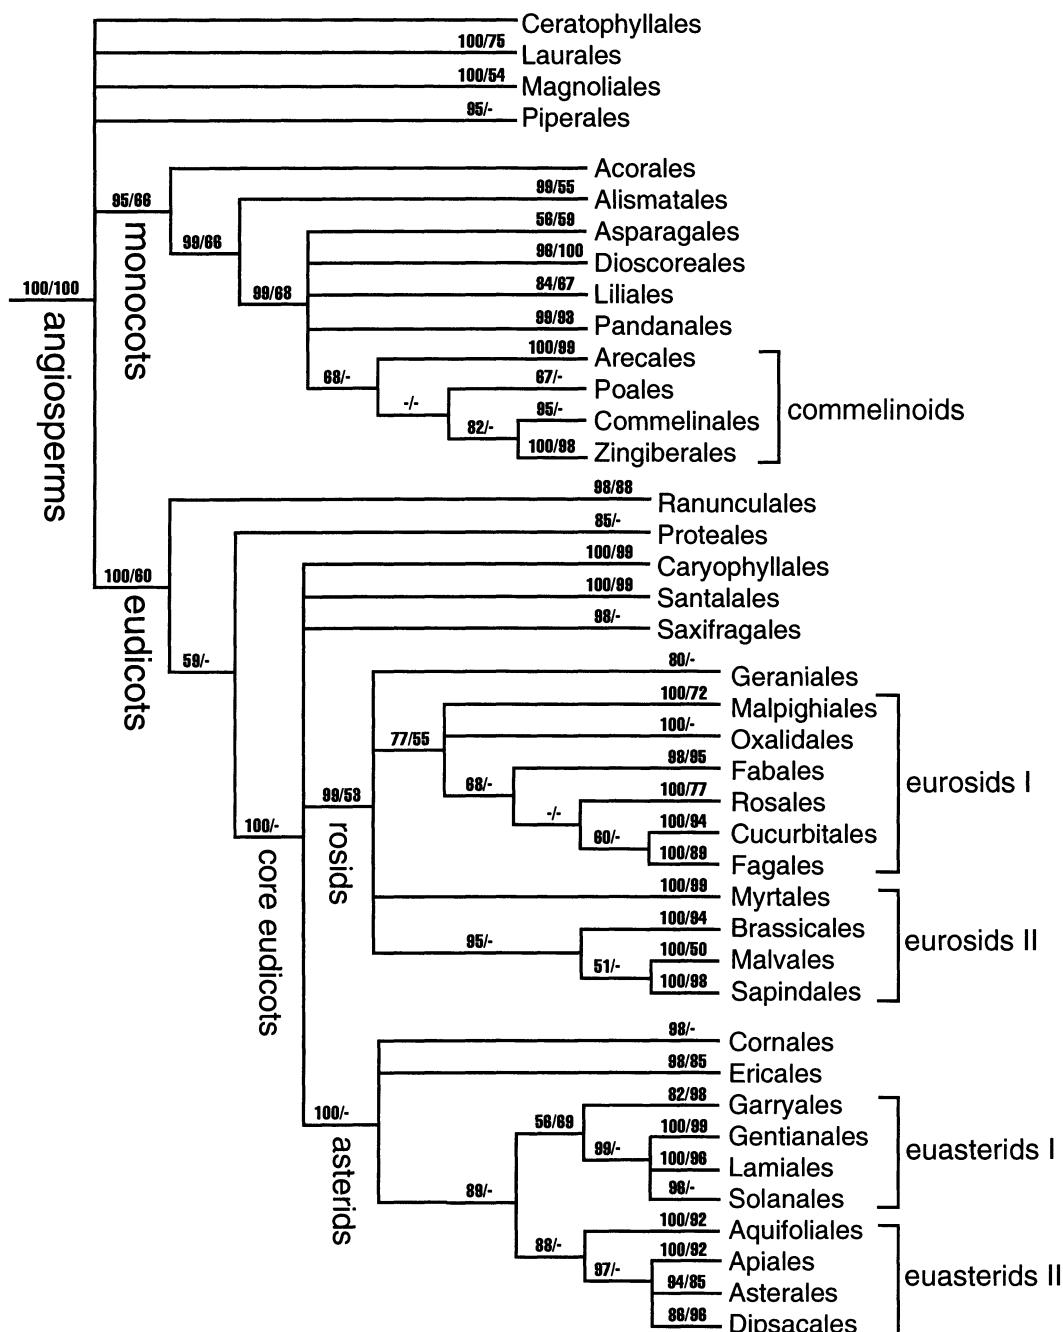

Figure 1. Phylogenetic interrelationships of the orders of flowering plants, compiled from recent cladistic analyses cited in the text. Jackknife support is given on the branches (a dash for values < 50%), first jackknife values from analysis of 545 sequences of the *rbcL*, *atpB*, and 18S rDNA genes (D. E. Soltis, M. W. Chase, P. S. Soltis, D. Albach, M. E. Mort, V. Savolainen, M. Zanis & J. S. Farris, unpublished, in prep.) and second jackknife values from analysis of 2538 *rbcL* sequences (Källersjö et al., 1998).

they belong neither in any of the phylogenetically “basal” orders at the beginning nor in the monocots or eudicots. Furthermore, families listed directly under monocots without an order are monocots but not commelinoids, and families similarly listed directly under eudicots and core eudicots are eudicots or core eudicots, respectively, but neither rosids nor asterids. At the end of the system is an additional list of families of uncertain position. Most of these are probably eudicots (including core eudicots, rosids, and asterids), but so far there are no firm data supporting their placement anywhere within the eudicots.

## CLASSIFICATION OF FLOWERING PLANTS

Amborellaceae	Limnocharitaceae
Austrobaileyaceae	Posidoniaceae
Canellaceae	Potamogetonaceae
Chloranthaceae	Ruppiaceae
Hydnoraceae	Scheuchzeriaceae
Illiciaceae	Tofieldiaceae
Nymphaeaceae	Zosteraceae
[+ Cabombaceae]	
Rafflesiaceae	Asparagales Bromhead
Schisandraceae	Agapanthaceae
Trimeniaceae	Agavaceae
Winteraceae	Alliaceae
Ceratophyllales Bisch.	Amaryllidaceae
Ceratophyllaceae	Anemarrhenaceae
Laurales Perleb	Anthericaceae
Atherospermataceae	Aphyllanthaceae
Calycanthaceae	Asparagaceae
Gomortegaceae	Asphodelaceae
Hernandiaceae	Asteliaceae
Lauraceae	Behniaceae
Monimiaceae	Blandfordiaceae
Siparunaceae	Boryaceae
Magnoliales Bromhead	Convallariaceae
Annonaceae	Doryanthaceae
Degeneriaceae	Hemerocallidaceae
Eupomatiaceae	Herreriaceae
Himantandraceae	Hesperocallidaceae
Magnoliaceae	Hyacinthaceae
Myristicaceae	Hypoxidaceae
Piperales Dumort.	Iridaceae
Aristolochiaceae	Ixioliriaceae
Lactoridaceae	Lanariaceae
Piperaceae	Laxmanniaceae
Saururaceae	Orchidaceae
MONOCOTS	Tecophilaeaceae
Corsiaceae	Themidaceae
Japonoliriaceae	Xanthorrhoeaceae
Nartheciaceae	Xeronemataceae
Petrosaviaceae	Dioscoreales Hook. f.
Triuridaceae	Burmanniaceae
Acorales Reveal	Dioscoreaceae
Acoraceae	Taccaceae
Alismatales Dumort.	Thismiaceae
Alismataceae	Trichopodaceae
Aponogetonaceae	Liliales Perleb
Araceae	Alstroemeriaceae
Butomaceae	Campynemataceae
Cymodoceaceae	Colchicaceae
Hydrocharitaceae	Liliaceae
Juncaginaceae	Luzuriagaceae

CLASSIFICATION OF FLOWERING PLANTS  
(cont'd.)

Pandanales Lindl.	Proteales Dumort.
Cyclanthaceae	Nelumbonaceae
Pandanaceae	Platanaceae
Stemonaceae	Proteaceae
Velloziaceae	Ranunculales Dumort.
COMMELINOIDS	Berberidaceae
Abolbodaceae	Circaeasteraceae
Bromeliaceae	[+Kingdoniaceae]
Dasypogonaceae	Eupteleaceae
Hanguanaceae	Lardizabalaceae
Mayacaceae	Menispermaceae
Rapateaceae	Papaveraceae
Arecales Bromhead	[+Fumariaceae]
Arecaceae	[+Pteridophyllaceae]
Ranunculaceae	
Commelinales Dumort.	CORE EUDICOTS
Commelinaceae	Aextoxicaceae
Haemodoraceae	Berberidopsidaceae
Philydraceae	Dilleniaceae
Pontederiaceae	Gunneraceae
Poales Small	Myrothamnaceae
Anarthriaceae	Vitaceae
Centrolepidaceae	Caryophyllales Perleb
Cyperaceae	Achatocarpaceae
Ecdeiocoleaceae	Aizoaceae
Eriocaulaceae	Amaranthaceae
Flagellariaceae	Ancistrocladaceae
Hydatellaceae	Asteropeiaceae
Joinvilleaceae	Basellaceae
Juncaceae	Cactaceae
Poaceae	Caryophyllaceae
Prioniaceae	Didiereaceae
Restionaceae	Dioncophyllaceae
Sparganiaceae	Droseraceae
Thurniaceae	Drosophyllaceae
Typhaceae	Frankeniacae
Xyridaceae	Molluginaceae
Zingiberales Griseb.	Nepenthaceae
Cannaceae	Nyctaginaceae
Costaceae	Physenaceae
Heliconiaceae	Phytolaccaceae
Lowiaceae	Plumbaginaceae
Marantaceae	Polygonaceae
Musaceae	Portulacaceae
Strelitziaceae	Rhabdodendraceae
Zingiberaceae	Sarcobataceae
EUDICOTS	Simmondsiaceae
Buxaceae	Stegnospermataceae
Didymelaceae	Tamaricaceae
Sabiaceae	Santalales Dumort.
Trochodendraceae	Olacaceae
[+Tetracentraceae]	Opiliaceae

CLASSIFICATION OF FLOWERING PLANTS  
(cont'd.)

Loranthaceae	Fabales Bromhead
Misodendraceae	Fabaceae
Santalaceae	Polygalaceae
Saxifragales Dumort.	Quillajaceae
Altingiaceae	Surianaceae
Cercidiphyllaceae	Fagales Engl.
Crassulaceae	Betulaceae
Daphniphyllaceae	Casuarinaceae
Grossulariaceae	Fagaceae
Haloragaceae	Juglandaceae
Hamamelidaceae	Myricaceae
Iteaceae	Nothofagaceae
Paeoniaceae	Rhoipteleaceae
Penthoraceae	Ticodendraceae
Pterostemonaceae	
Saxifragaceae	Malpighiales Mart.
Tetracarpaceae	Achariaceae
ROSIDS	Balanopaceae
Aphloiaceae	Caryocaraceae
Crossosomataceae	Chrysobalanaceae
Ixerbaceae	Clusiaceae
Krameriaceae	Dichapetalaceae
Picramniaceae	Erythroxylaceae
Podostemaceae	Euphorbiaceae
Stachyuraceae	Euphroniaceae
Staphyleaceae	Flacourtiaceae
Tristichaceae	Goupiaceae
Zygophyllaceae	Hugoniaceae
Geriales Dumort.	Humiriaceae
Francoaceae	Irvingiaceae
Geraniaceae	Ixonanthaceae
[+Hypseocharitaceae]	Lacistemataceae
Greyiaceae	Linaceae
Ledocarpaceae	Malesherbiaceae
Melianthaceae	Malpighiaceae
Vivianiaceae	Medusagynaceae
EUROSIDS I	Ochnaceae
Celastraceae	Pandaceae
Huaceae	Passifloraceae
Parnassiaceae	Putranjivaceae
[+Lepuropetalaceae]	Quiinaceae
Stackhousiaceae	Rhizophoraceae
Cucurbitales Dumort.	Salicaceae
Anisophylleaceae	Scyphostegiaceae
Begoniaceae	Trigoniaceae
Coriariaceae	Turneraceae
Corynocarpaceae	Violaceae
Cucurbitaceae	
Datisaceae	Oxalidales Heintze
Tetramelaceae	Cephalotaceae
	Connaraceae
	Cunoniaceae
	Elaeocarpaceae
	Oxalidaceae
	Tremandraceae

CLASSIFICATION OF FLOWERING PLANTS  
(cont'd.)

Rosales Perleb	Onagraceae
Barbeyaceae	Penaeaceae
Cannabaceae	Psiloxylaceae
Cecropiaceae	Rhynchosocalycaceae
Celtidaceae	Vochysiaceae
Dirachmaceae	
Elaeagnaceae	Sapindales Dumort.
Moraceae	Anacardiaceae
Rhamnaceae	Biebersteiniaceae
Rosaceae	Burseraceae
Ulmaceae	Kirkiaceae
Urticaceae	Meliaceae
	Nitrariaceae
EUROSIDS II	[+Peganaceae]
Tapisciaceae	Rutaceae
Brassicales Bromhead	Sapindaceae
Akaniaceae	Simaroubaceae
[+Bretschneideraceae]	
Bataceae	ASTERIDS
Brassicaceae	Cornales Dumort.
Caricaceae	Cornaceae
Emblingiaceae	[+Nyssaceae]
Gyrostemonaceae	Grubbiaceae
Koeberliniaceae	Hydrangeaceae
Limnanthaceae	Hydrostachyaceae
Moringaceae	Loasaceae
Pentadiplandraceae	
Resedaceae	Ericales Dumort.
Salvadoraceae	Actinidiaceae
Setchellanthaceae	Balsaminaceae
Tovariaceae	Clethraceae
Tropaeolaceae	Cyrillaceae
Malvales Dumort.	Diapensiaceae
Bixaceae	Ebenaceae
[+Diegodendraceae]	Ericaceae
Cistaceae	Fouquieriaceae
Cochlospermaceae	Halesiaceae
Dipterocarpaceae	Lecythidaceae
Malvaceae	Marcgraviaceae
Muntingiaceae	Myrsinaceae
Neuradaceae	Pellicieraceae
Sarcolaenaceae	Polemoniaceae
Sphaerosepalaceae	Primulaceae
Thymelaeaceae	Roridulaceae
Myrtales Rchb.	Sapotaceae
Alzateaceae	Sarraceniaceae
Combretaceae	Styracaceae
Crypteroniaceae	Symplocaceae
Heteropyxidaceae	Ternstroemiaceae
Lythraceae	Tetrameristaceae
Melastomataceae	Theaceae
Memecylaceae	Theophrastaceae
Myrtaceae	
Oliniaceae	EUASTERIDS I
	Boraginaceae
	Plocospermataceae
	Vahliaceae

CLASSIFICATION OF FLOWERING PLANTS  
(cont'd.)

Garryales Lindl.	Apiales Nakai
Aucubaceae	Apiaceae
Eucommiaceae	Araliaceae
Garryaceae	Aralidiaceae
Oncotrichaceae	Griseliniaeeae
Gentianales Lindl.	Melanophyllaceae
Apocynaceae	Pittosporaceae
Gelsemiaceae	Torricelliaceae
Gentianaceae	Aquifoliales Senft
Loganiaceae	Aquifoliaceae
Rubiaceae	Helwingiaceae
Lamiales Bromhead	Phyllonomaceae
Acanthaceae	Asterales Lindl.
Avicenniaceae	Alseuosmiaceae
Bignoniaceae	Argophyllaceae
Buddlejaceae	Asteraceae
Byblidaceae	Calyceraceae
Cycloceratilaceae	Campanulaceae
Gesneriaceae	[+ Lobeliaceae]
Lamiaceae	Carpodetaceae
Lentibulariaceae	Donatiaceae
Myoporaceae	Goodeniaceae
Oleaceae	Menyanthaceae
Orobanchaceae	Pentaphragmataceae
Paulowniaceae	Phellinaceae
Pedaliaceae	Rousseaceae
[+ Martyniaceae]	Styliadiaceae
Phrymaceae	Dipsacales Dumort.
Plantaginaceae	Caprifoliaceae
Schlegeliiaceae	Diervillaceae
Scrophulariaceae	Dipsacaceae
Stilbaceae	Linnaeaceae
Tetrachondraceae	Morinaceae
Verbenaceae	Valerianaceae
Solanales Dumort.	FAMILIES OF UNCERTAIN POSITION
Convolvulaceae	Balanophoraceae
Hydrolytaceae	Bonnetiaceae
Montiniaceae	Cardiopteridaceae
Solanaceae	Ctenolophonaceae
Sphenocleaceae	Cynomoriaceae
EUASTERIDS II	Cytinaceae
Adoxaceae	Dipentodontaceae
Bruniaceae	Elatinaceae
Carlemanniaceae	Geissolomataceae
Columelliaceae	Hoplestigmataceae
[+ Desfontainiaceae]	Kaliphoraceae
Eremosynaceae	Lepidobotryaceae
Escalloniaceae	Lissocarpaceae
Icacinaceae	Lophopyxidaceae
Polyosmaceae	Medusandraceae
Sphenostemonaceae	Metteniusaceae
Tribelaceae	Mitrastemonaceae
	Paracryphiaceae

Theales Lindl.	Zosteraceae Nakai
= Ericales	= Alismatales
Thelioniales Nakai	Zygophyllaceae Takht.
= Gentianales	- not accepted, family under rosids
Thymelaeales Willk.	
= Malvales	
Tiliaceae Caruel	
= Malvales	
Tofieldiales Reveal & Zomlefer	
= Alismatales	
Torriceillales Takht. ex Reveal	
= Apiales	
Tovariaceae Nakai	
= Brassicales	
Trilliaceae Takht.	
= Liliales	
Triuridales Hook. f.	
- not accepted, family under monocots	
Trochodendrales Takht. ex Cronquist	
- not accepted, family under eudicots	
Tropaeolales Takht. ex Reveal	
= Brassicales	
Turneriales Dumort.	
= Malpighiales	
Typhaceae Dumort.	
= Poales	
Ulmiales Lindl.	
= Rosales	
Urticales Dumort.	
= Rosales	
Vacciniales Dumort.	
= Ericales	
Vallisneriales Nakai	
= Alismatales	
Velloziaceae R. Dahlgren ex Reveal	
= Pandanales	
Veratales Dumort.	
= Liliales	
Verbenales Horan.	
= Lamiales	
Viburnales Dumort.	
- not accepted, family under euasterids II	
Vincales Horan.	
= Gentianales	
Violales Perleb	
= Malpighiales	
Vitales Reveal	
- not accepted, family under core eudicots	
	SELEATED FAMILIAL SYNONYMS
	Abrophyllaceae
	= Carpodetaceae
	Acanthochlamydaceae
	= Velloziaceae
	Aceraceae
	= Sapindaceae
	Achradaeae
	= Sapotaceae
	Aegicerataceae
	= Myrsinaceae
	Agdestidaceae
	= Phytolaccaceae
	Aitoniacae
	= Meliaceae
	Alangiaceae
	= Cornaceae
	Aloaceae
	= Asphodelaceae
	Alsinaceae
	= Caryophyllaceae
	Ambrosiaceae
	= Asteraceae
	Amygdalaceae
	= Rosaceae
	Androstachyaceae
	= Euphorbiaceae
	Antoniaceae
	= Loganiaceae
	Apodanthaceae
	= Rafflesiaceae
	Apostasiaceae
	= Orchidaceae
	Aptandraceae
	= Olacaceae
	Aristolochiaceae
	= Elaeocarpaceae
	Asclepiadaceae
	= Apocynaceae
	Asteranthaceae
	= Lecythidaceae
	Averrhoaceae
	= Oxalidaceae
	Avetaceae
	= Dioscoreaceae

CLASSIFICATION OF FLOWERING PLANTS  
(cont'd.)

Balanitaceae	Capparaceae
= Zygophyllaceae	= Brassicaceae
Barbeiuaceae	Carduaceae
= Phytolaccaceae	= Asteraceae
Barclayaceae	Cassythaceae
= Nymphaeaceae	= Lauraceae
Barringtoniaceae	Chailletiaceae
= Lecythidaceae	= Dichapetalaceae
Baueraceae	Chenopodiaceae
= Cunoniaceae	= Amaranthaceae
Baxteriaceae	Chionographidaceae
= Dasypogonaceae	= Melanthiaceae
Bembiciaceae	Chloanthaceae
= Flacourtiaceae	= Lamiaceae
Berzeliaaceae	Cichoriaceae
= Bruniaceae	= Asteraceae
Bischofiaceae	Cleomaceae
= Euphorbiaceae	= Brassicaceae
Blepharocaryaceae	Cneoraceae
= Anacardiaceae	= Rutaceae
Boerlagellaceae	Cobaeaceae
= Sapotaceae	= Polemoniaceae
Bombacaceae	Compositae
= Malvaceae	= Asteraceae
Boopidaceae	Conostylidaceae
= Calyceraceae	= Haemodoraceae
Bretschneideraceae	Cordiaceae
= Akaniaceae	= Boraginaceae
Brexiaceae	Coridaceae
= Celastraceae	= Primulaceae
Brunelliaceae	Corokiaceae
= Cunoniaceae	= Argophyllaceae
Brunoniaceae	Corylaceae
= Goodeniaceae	= Betulaceae
Bumeliaceae	Croomiaceae
= Sapotaceae	= Stemonaceae
Burchardiaceae	Cruciferae
= Colchicaceae	= Brassicaceae
Byttneriaceae	Curtisiaceae
= Malvaceae	= Cornaceae
Cabombaceae	Cuscutaceae
= Nymphaeaceae	= Convolvulaceae
Caesalpiniaceae	Cyananthaceae
= Fabaceae	= Campanulaceae
Calectasiaceae	Cyanastraceae
= Dasypogonaceae	= Tecophilaeaceae
Callitrichaceae	Cynocrambaceae nom. illeg.
= Plantaginaceae	= Rubiaceae
Calochortaceae	Cyphiaceae
= Liliaceae	= Campanulaceae
Camelliaceae	Cyphocarpaceae
= Theaceae	= Campanulaceae
Canotiaceae	Cypripediaceae
= Celastraceae	= Orchidaceae
Cansjeraceae	Dactylanthaceae
= Opiliaceae	= Balanophoraceae

CLASSIFICATION OF FLOWERING PLANTS  
(cont'd.)

Davidiaceae	Frangulaceae
= Cornaceae	= Rhamnaceae
Davidsoniaceae	Fumariaceae
= Cunoniaceae	= Papaveraceae
Decaisneaceae	Funkiaceae
= Lardizabalaceae	= Agavaceae
Desfontainiaceae	Galacaceae
= Columelliaceae	= Diapensiaceae
Dialypetalanthaceae	Geitonoplesiaceae
= Rubiaceae	= Hemerocallidaceae
